

ProClean® Septic & Cesspool Treatment

The ProClean® Septic & Cesspool Treatment is a commercial-grade product that breaks down greases, starches, proteins, and other organic materials that clog septic tanks, drainage fields, and cesspools.

Its high potency formulation of cultured bacterial action is vital to a septic or cesspool system's proper operation. It also contains growth promoters for vigorous bacterial activity and because it contains no solvents it is environmentally safe. ProClean® Septic & Cesspool Treatment is approved for use by municipalities and water treatment facilities across the country.

In a typical septic system, waste (including discarded food scraps, laundry water, cooking oils and grease) flows to a watertight septic tank where it is decomposed by bacteria. In the tank, the complex food and waste particles are broken down by natural bacterial processes so they can percolate into the subsoil surrounding a drainage field.

Inside the tank, the majority of the waste decomposes into sewage water, while heavier solids settle to the bottom and accumulate as sludge. Other lighter particles, including grease and oil, rise to the surface and form a scum.

The decomposed sewage water then flows from the tank through a distribution box and into a drainage field - a series of perforated pipes laid below ground in a bed of gravel. The liquid leaches out through the gravel and is further purified as it percolates through the soil. The more complete the decomposition of the waste, the more efficiently and trouble free a septic system functions.

However, when a septic system is overloaded or not properly maintained, the bacterial decomposition can slow or stop, causing untreated liquid and solid wastes to overflow into the soil. Excessive use of bleaches, disinfectants and caustic or acid drain cleaners also deters the bacterial action of the system and greases and solids can buildup until they choke the system and block the flow of the liquid into the soil.

In a cesspool, just as in a septic tank, organic waste is broken down before it percolates into the ground. If greases and solids buildup due to a lack of bacterial action, the cesspool drainage area can become clogged.

ProClean® Septic & Cesspool Treatment's unique, high-potency formulation restores the bacterial action that is vital to your cesspool's or septic system's proper operation.

Ask about availability in Canada.

ProClean® Septic & Cesspool Treatment is available in two-ounce water soluble pouches with 12 pouches to a container and 12 containers to a case, part number PC7. It is also available in a made-to-order 25 pound pail, part number PC725.
