

# Safety Wrap™

## Safety Wrap™ *Safety beyond procedures*

Working on or around exposed pipelines requires an increased level of safety and awareness. Installing Safety Wrap as soon as pipes are exposed will protect the integrity as well as the vital coatings from any degree of accidental line strike. The wrap is so durable it can withstand even a direct hit without being breached. The bright orange color increases visibility and ensures machine operators keep back a safe distance.

Originally designed to protect coatings during foreign crossings, Safety Wrap has been used in a number of applications to increase the level of safety on the job site:

- Coating Repairs
- Maintenance Exposures
- Washouts
- Sand Blasting
- Bridge Work
- Casing Repairs
- High Voltage Electric Cables

Every pipeliner monitoring 3rd party work is putting his life in the hands of an equipment operator he may or may not even know. Protect those workers and inspectors on every job site by insuring a tragic mistake or equipment failure doesn't result in a dangerous release.

### Safety Wrap comes in two versions:

- The **Spiral Wrap** is designed to protect pipes from 2" to 12". The wrap is easily installed in just minutes with minimal clearance.
- The **Multi-Piece Wrap** will protect larger pipes from 16" to 42" and beyond. Simply snap the panels together and secure with smart bands to provide the needed protection for critical large diameter pipelines.

## Smart Bands

Easy-to-adjust Smart Bands are reusable and have no metal to scratch the pipe or corrode. Four bands are included with each multi-piece unit.
